ANDROSCOGGIN RIVER STUDIES

TWENTY-FIRST ANNUAL REPORT

1963

by

Walter A. Lawrance

•

Lewiston, Maine November, 1963

TWENTY-FIRST

ANNUAL REPORT

1963

INDEX

		P	age	S
1.	Lewiston-Auburn General Data	1	to	16
2.	Androscoggin River and Pool Data	17	to	26
3.	Mill Pollution to Androscoggin River	27	to	49
4.	Benthal Activity in the Pool	50	to	84
5.	Analytical Data	85	to	149
6.	Press Reports and News Items	1	to	76
7.	Summaries One, Two, Three, and Four (Placed in front of Page one, Part One) 16, 2	26,	49,	56
8.	Plots 12A, 13A, 18A, 18B, 19A, 20A, 23A, 23B, 50A, 54A, 54B,	, 23	SC,	32A,

Part One

- 1. Objectionable river odor was not present in Lewiston-Auburn area during the entire season.
- The Pollution Factor was 0.06; in 1941 it was 5.1. Sulphite spent liquor to river averaged 89.8 T/Wk; 1941, 5820 T/Wk.
- 3. The dissolved oxygen content in the river water in the Lewiston area was unsatisfactory until about the middle of August. B.O.D.'s usually were small.
- 4. In general terms, the river is in a better condition than it has been during, at least, the past twenty-three years.
- 5. Local Press editorials were very favorable.
- 6. Local committees concerned with Pollution and Parks along the river and Pool have been active.

Part Two

Androscoggin River and Pool Analyses

- 1. The B.O.D. record is the subject of separate treatment elsewhere in this report.
- 2. Dissolved Oxygen in the river water was more than adequate for the five day B.O.D. demands at all sampling stations except Dixfield.
- 3. The tonnage of available Dissolved Oxygen present, June through September, at the stations chosen for special study has been tabulated. The Pool area lost an average of twenty tons D.O. per day plus all reaeration oxygen.
- 4. Reaeration downstream from Lewiston is rapid. At Lisbon Falls the river water was at or near saturation all through the summer.
- 5. Oxygen Consumed from Permangate tests indicated the lowest average loss in the Pool since these analyses were systematically begun in 1949; 3.0 ppm or 20.55 T/d.
- 6. Methylene Blue Stabilities were satisfactory but did not indicate expected increases.

Part Three

Mill Pollution

- 1. Based on the 1963 season's analytical results and expressed in Population Equivalents:
 - (a) Brown Company Pollution load to the river was 267,000 minus 17,500 equal to 249,500.
 - (b) The total pollution load leaving Public Service was 313,920 P.E. At Gilead, Maine this load was reduced to 220,680 P.E.; a reduction of about 30%
 - (c) Oxford Paper Company pollution load to the river was 367,900 minus 11,000 P.E. equal to 356,900 P.E.
 - (d) International Paper Company probable pollution load to the river was about 65,000 P.E.
- 2. With the exception of the Berlin area these population equivalents approximate those recorded in the H.E.W. report.
- 3. The apparent reduction of B.O.D. load in the Pool and to Deer Rips Dam is 6.37 T/d. This indicates considerable B.O.D. increment in the Pool, since the average daily loss of Dissolved Oxygen was 19.13 tons per day, excluding reaeration.
- 4. Due to stratification, water samples from Gulf Island Dam station were not as representative as those from Deer Rips station.

Fart Four

Benthal Activity in the Pool 1963

- 1. Biochemical Oxygen Demands and Dissolved Oxygen were determined six days each week for thirteen weeks, at North Turner and Turner Center Bridges and Guld Island Dam. Five days each week at Mile 4.25 and Mile 2.5. The study period at Mile 4.25 was nine weeks.
- 2. B.O.D. data for a nine week period at all stations has been tabulated.
- 3. The area between Turner Center Bridge and Mile 4.25 contributed the most Benthal B.O.D. It is not the area containing the largest Benthal deposits.
- 4. Benthal activity in the Pool is very large and still serious. It has a devastating demand on the oxygen resources in the Pool; at least twenty tons per day.
- 5. The oxygen sag point appears to be moving slowly northward into the Pool.

TWENTY-FIRST ANNUAL REPORT

PART ONE

LEWISTON-AUBURN GENERAL DATA

1963

Introduction.

The format of this report is somewhat

different from that used in previous

years. The abandoment of the sulphite pulping process at Berlin and Rumford has produced a decrease in the pollution load which renders obsolete certain comparisons and standards used prior to this year.

Daily Report Data. The daily reports numbered one to one hundred and eight contain a record of

- a. River Odor, types and intensities
- b. Air temperatures
- c. General weather conditions
- d. Direction of wind
- e. Water passing over Lewiston Falls
- f. Surface appearance of the river
- g. Conditions at Gulf Island and Deer Rips Dams (occasionally)

River Odor, Types etc. The river odor in the Lewiston-Auburn city areas was non existent except

on six days when a very slight musty odor was recorded. For this reason comparisons of odor observations with previous years have been omitted. There was no general coverage of odor. Odor at the Dams was absent or at a very low level. Hydrogen sulphide was not observed during August and September. Slight traces were recorded occasionally in July. Air Temperatures.

June and July were above the long

range average; those for August and September were below the average.

TABLE #1

Mean Hourly Air Temperatures (OF)

Year	June	July	August	September
1963 1962 1961	65.97 64.82 64.08	70.89 65.39 67.27	63.80 65.68 68.06	56.07 57.35 66.03
79 year average	63.20	68.88	66.70	59.20
Deviation from Average	+2.77	42.0l	-2.90	-2.13

Precipitation.

During June, July and September

precipitation was very small, however,

August rainfall was above average. A considerable deficit existed for the four month period.

TABLE #2

Precipitation (Inches) Lewiston

Year	June	July	August	September
1963 1962 1961	1.02 1.40 3.15	1.23 2.81 3.46	5.71 4.57 1.61	1.74 3.05 3.92
89 year average	3.34	3.47	3.09	3,55
Deviation from Average	-2.32	-2.24	<i>+</i> 2.62	-1.81

River Surface Conditions.

Whitish foam, film and occasionally brownish scum were present usually

covering small areas of the river between the North and South Bridges.

Floating sludge was visible on the surface of the Androscoggin Pool north of Mile Three in somewhat larger amounts than were observed in 1962. However, after the third week of July there was a marked decrease and only very small amounts of floating sludge were observed during August and September. The production of gas appeared to have a similar sequence. Pig-pen odor was present near floating sludge areas in the Pool.

Pollution Load Factors.

These factors are calculated from the

tons of sulphite waste liquor dis-

charged to the river and the daily river flows. During the 1963 season there was no sulphite liquor discharged to the river north of Chisholm. From June 3 to September 30 the International Paper Company's average weekly discharge of waste sulphite liquor to the lagoon was that produced in excess of about ninety tons. The weekly data of tonnage discharged to the river are recorded in Table P.L.F. #1. The factors which are at an all-time low do not, of course, include the pollutional effect of any Kraft black liquor discharged to the river, suspended solids etc.

The magnitude of the reduction of spent sulphite liquor discharged to the river may be shown by comparing the 1941 data with that of 1963. In the 1941 season the weekly tonnage averaged 5820 and the pollution factor 5.1. The corresponding

figures for 1963 are 89.8 and 0.06.

<u>River Flows</u>. The river flow during May was approximately equal to the twenty-six year average. In the entire period June through September, river flows were consistently below this long-time average. June flows were about 35% below the twenty-six year average. During the period July through September, the river flow was more

uniform than most similar periods in other years.

*Based on Thursday reports **June through mid September based on daily reports.

Lewiston 1963.

For the fourth successive year there was no objectionable river odor in

the down-town Lewiston-Auburn area, and there was no general odor coverage.

Biochemical oxygen demands were low, usually below two ppm and occasionally below one ppm. The dissolved oxygen content of the river water arriving in Lewiston was unsatisfactory for most of June and all of July. About the middle of August a marked improvement occurred and was maintained during the remainder of the season. The probable reasons for this change are discussed elsewhere in this report.

Local editorial press reports were favorable. The news item in the Journal (cf page 46 "Press reports" in this report) created considerable interest among certain local sports groups.

Local committees appointed by the Mayor have become interested in establishing park and boating facilities in the Pool areas north of the Dam. Visits by boat have been made but nothing specific has been done to date. (cf Press Reports).
